Computational Mechanics

Part number. Topic

Reading guide

Xavier Poncini (Simplex)

Open with one short paragraph that connects the session to the material participants have already covered and states what they will do next.

Session at a glance

1. **Readings (duration).** State the priority order and where to find the reading route.
2. **Discussion (duration).** State the group size and purpose.

Readings

Explain how to prioritise the readings and how participants can check their understanding.

[Main]

Paper title

Reading route

- **Skim.** Sections to orient the reader.
- **Read.** Sections requiring close attention.
- **Evaluation.** A concrete question that tests the central idea.

Overview. Give just enough context to make the selected sections intelligible. Keep claims, qualifications, and the evidence that supports them together.

[Extension]

Paper title

Reading route

- **Skim.** Optional orientation sections.
- **Read.** The most relevant extension sections.
- **Evaluation.** A question that exposes the connection to the main reading.

Overview. Explain what the extension adds and why it matters for the course's argument.

Discussion

Use a small set of open prompts that ask participants to distinguish evidence, interpretation, limitations, and alternative explanations.

- What is the strongest piece of evidence?
- What remains uncertain?
- What experiment would discriminate between competing explanations?

Supporting evidence

Replace this box with a legible figure, table, or compact derivation.

Keep the interpretation and any limitation beside the evidence. Give the source, figure or page number, and a stable link where available.

Replace all specimen text before distributing the guide.
