Module title

Part number. Topic

Xavier Poncini (Simplex)

Course date

An explanation with its supporting evidence

A complete sentence states the relationship the audience should examine. Keep the assumptions and qualifications next to that relationship.

Evidence

Place an original figure, derivation, or measured result here.

Keep labels legible and show the quantities needed for comparison in the same view.

Interpretation

Explain how the evidence supports the claim.

State any limitation that changes the conclusion at body size.

Author, work, year, page or figure. Use a DOI or stable link when available.

A mathematical relationship with its assumptions

For discrete random variables X and Y , Bayes' rule gives

$$p(x | y) = \frac{p(y | x) p(x)}{p(y)}, \quad p(y) > 0.$$

The prior $p(x)$ and likelihood $p(y | x)$ determine the posterior $p(x | y)$. The denominator normalises the distribution.

The condition $p(y) > 0$ belongs beside the formula.

Comparable quantities in a single table

Put the unit in the column heading and align comparable values.

Model	Parameters (count)	Measurement uncertainty
Example A	<i>value</i>	<i>interval or qualifier</i>
Example B	<i>value</i>	<i>interval or qualifier</i>

These are placeholders, not experimental results.

Replace with the source and the conditions of measurement.
